The ubiquitin-proteasome pathway plays an important role in the removal of intracellular proteins and cellular events. Recent studies in mammalian cells showed that proteasome subunit expression and activity is cell-cycle regulated, with the higher expression and activity of the 19S regulatory particle during the G(1) phase and then reduced during S-phase. Furthermore, analysis of proteasome 20S protease activities in a variety of cell lines and primary cells revealed that this pathway has an on-off switch in response to the progression of the cell cycle. This review briefly summarizes the recent discoveries in the field of proteasome regulatory mechanisms and their role in cell-cycle progression. $l(s) = 18 * s - 2.8$. $W h a t i s 4 * f (b) - 3 * 1 (b) ? - 1 8 * b + 2.4$ $L e t d (s) = - 2 * s * * 3 + 5 * s * * 2 - s + 1 2 3.5$. $L e t o (n) = - n * * 3 + 2 * n * * 2 - n + 1$. $D e t e r m i n e - d (i) + o (i)$. iald647c40b
