

* **Photoshop Elements:** Essentially a scaled-down version of Photoshop, Photoshop Elements offers a lower learning curve than Photoshop. It's designed for basic, non-destructive image retouching, such as removing red eye and blemishes, and features a more limited set of tools than the full-featured Photoshop. * **GIMP:** An open source program designed by the same team at Adobe that produces Photoshop. Although many users say it's not as powerful, it's free and can help you create really impressive images. Of course, many of the same tools available in Photoshop can also be found in GIMP. * **Illustrator:** Adobe's vector-based drawing software, Illustrator enables you to create shape and design files. You can apply a number of effects and icons to a design in Illustrator, which you can then apply to any image with a few mouse clicks. Be aware that Illustrator can be very processor intensive, so any large files can slow a computer down. * **Flash:** The free graphics programming software from Adobe is designed for creating animation and web graphics. Flash is only available for use on Macs and PCs.

Human CD14 promotes dendritic cell differentiation and melanoma metastasis. High-level expression of CD14, which is the only cell-surface receptor for lipopolysaccharide, is a characteristic of monocytes and macrophages. Recent evidence suggests, however, that CD14 is also a critical costimulatory molecule for T cell activation and can function as a receptor for cell-surface molecules that stimulate human monocyte-derived dendritic cells (Mo-DC). To study the function of CD14 in human DC, we analyzed the ability of human CD14+ cells to support Mo-DC differentiation and function. We show that CD14+ cells, but not CD14- cells, promote DC maturation and stimulate the release of IL-12 from DC. The ability of CD14+ cells to support DC differentiation was found to be dependent on cell-cell contact, because cell-free CD14+ conditioned medium failed to substitute for the effect of CD14+ cells. CD14+ cells also promote DC cross-priming as well as CD4+ T cell-mediated IFN-gamma production. Furthermore, we found that CD14+ cells promote tumor cell migration in vitro through interaction with cells of the mesothelium, suggesting that this interaction may have pathologic consequences in vivo. Thus, this study identifies a previously unrecognized role for CD14+ cells in both T cell activation and cell-cell interactions relevant to the development of dendritic cells and their precursors. Justin Bieber's concert in Germany has been canceled after fans turned up ready to cause a scene, according to local media. "We could not give our audience the full experience that they deserved after what happened in Munich in January 2015," organizers said in a statement. Justin Bieber will still play in the city this September. The 16-year-old singer's "Purpose: Believe" tour had drawn huge crowds across the world and was on track to be the biggest tour of 2017. But after a concert in the German city of Munich in January 2015, where fans threw eggs and chairs, several concerts have been canceled, including in Ireland, the Netherlands, Austria and the Netherlands. Last month, Bieber's tour was canceled in several cities across America and Canada after violent protests in several cities turned ugly. Bieber did not take kindly to the fans. "There was a lot of yelling and screaming," Bieber told CBS' "The Late Show
