History Autodesk acquired the predecessor of AutoCAD, Novus, on September 20, 1993 and renamed it AutoCAD. In 1999, Autodesk also acquired Simutrans, a free-to-play tile-based cross-platform transport simulation game. Usage As CAD applications, AutoCAD and AutoCAD LT are mainly used by engineers, architects, designers and drafters. While AutoCAD is used for 2D

---

drafting, AutoCAD LT is used for 2D drafting and 2D drafting combined with 3D modeling, with the latter being the most-used version. In total, more than 15 million licenses have been sold worldwide, mostly in North America. Available Products

Graphics The graphics features of AutoCAD are: The Graphics User Interface, or G-UI, is a set of tools for creating, editing, and outputting drawings. Rendering, which determines the appearance of three-dimensional models. Simulation, which allows the user to see how an object would look when viewed from different angles or from different distances. 3D modeling tools such as creating and editing a 3D model, surface, or solid. Rendering tools

---

which enable the user to view and manipulate the images generated by rendering. Text tools, which are used to draw, edit, and view text and labels on drawings. Subscription Autodesk makes a variety of subscription products for AutoCAD and its predecessors. The type of subscription varies from single-product to fully featured professional packages. The subscription products offered to the public are: AutoCAD Subscription: including AutoCAD LT. AutoCAD Plus: includes the software and updates, for a perpetual licence, without the need to pay for additional licence fees when using an installed copy. AutoCAD Architecture, AutoCAD Electrical and AutoCAD Civil 3D, and AutoCAD Navisworks are all available as a subscription, and are included in the AutoCAD Plus package. Technical Support Autodesk has a range of technical support services: AutoCAD

---

Service and Training Center: includes instructional videos, software, and other content. Autodesk Engineering Center: provides support and training for AutoCAD and AutoCAD LT, other Autodesk software products, and third-party applications. Autodesk forums: forums where users can post questions and troubleshoot AutoCAD issues. Autodesk ExpertExchange: users can post questions and troubleshoot AutoCAD issues, with access to an expert, who will help to resolve the problem, and provide the user with a solution. Documentation Autodesk provides a number of free software manuals and tutorials. Releases Autodesk releases AutoCAD and AutoCAD LT as updates for the previous version, which means that users who have previously purchased a perpetual licence are always running the most recent version of the software. The software does not

---

become dated, but there is a 1-year release of a new version. A new version of AutoCAD is released once per year. The release is a download for use on the desktop version

Q: Using `CString::IndexOf` with Unicode string I am trying to implement an interface function which will identify the position of the first occurrence of a substring in a wide-character string. For the most part, it's working well but I'm having an issue with Unicode string. The code I have is: `CString strHtml = ... // Unicode string int startIdx = 0; int endIdx = strHtml.IndexOf(L"", startIdx);` The issue is that if I try to find the index of the first occurrence of the tag in this string: `<b>` The program fails to locate the first occurrence. I have searched and tried various combinations of the `IndexOf` flags (`lenient`, `ignore`, etc.) but nothing seems to work. Does anyone have any suggestions on how I can find the position of the first

---

occurrence of a particular character in a Unicode string? A: Unless you have reason to, don't use the CString APIs to parse HTML. The default CString APIs do not properly handle unicode strings properly. Start by using the more appropriate CWebBrowser or CWinApp::HtmlWindow. If you absolutely must use CString APIs, see the TextUtilities Sample. A: You can use the CString::AnsiCompareInfo() function to convert the string to an Ansi string. This way the Find() method will work correctly on the string. Example: #include "stdafx.h" #include #include int main() { LPCTSTR a = "ABCD"; LPCTSTR b = "BCD"; int iAnsi = \_stricmp(a, b); int iW = AnsiCompareInfo::Compare(a, b, iAnsi); std::cout
