Deep Space Waifu: Flat Justice Free Download.1. Field of the Invention The present invention relates to a technique of enhancing improvement in impact resistivity, shock absorbability and ventilation property when contacting with air of a soft and easily deformed rubber member such as pneumatic tires, diaphragms, vibration rubber parts and O-rings. 2. Description of the Related Art Rubber materials have been widely used for materials of automobile parts, electric and electronic parts, industrial parts, household goods and construction materials in addition to tires. When the rubber material is applied to parts requiring impact resistivity and shock absorbability, rubbers such as ethylene propylene diene monomer rubber (EPDM), nitrile rubber and silicone rubber are mainly used. Since these rubbers have superior properties such as impact resistivity and shock absorbability, these rubber materials have been widely used. However, these rubber materials have defects of high cost and low heat resistance and further need vulcanization treatment. Further, it is difficult to make the rubber material soft because of low degree of freedom of crosslinking and high crosslinking density. On the other hand, with respect to necessity to avoid occurrence of static electricity, it is known that air permeability and ventilation property of the rubber material are important factors. That is, since the static electricity is generated by friction of
