The Photoshop GUI (graphical user interface) can be intimidating to beginners and experts alike, and beginners often use Photoshop without fully understanding the editor's many features. Later in this chapter, I introduce you to the different features of the editor. Photoshop has all the same features that any other Adobe software product has, such as working with images, graphics, and multimedia. I provide a quick comparison of all the parts of Photoshop in the earlier sections of this chapter. While using Photoshop, remember that you can use it for most things — websites, graphic design, and so on. However, don't try to squeeze Photoshop into a project when you need to use something else or when you can do better using another tool. You also have to be careful about the tools that you download and use. This is especially true if the tool is available for the Mac or other computer platforms. Make sure that you use the version that's compatible with the computer on which you plan to use the tool. Fortunately, most tools that are available for download support Windows and Mac computers in one way or another. This chapter will help you understand the powerful features of Photoshop as well as help you use Photoshop efficiently. With just a few steps, you can master this powerful application. # Photoshop in a Nutshell Photoshop shows you what's on screen by displaying your image using different layers. Layers can be used to make images look better than they would otherwise, and they can change and transform images. Photoshop uses layers to make different aspects of an image visible or invisible — you name it. The layers in an image are called _layers_ because they layer things on top of each other. A layer contains an image as well as settings that control the style, color, and other characteristics of that image. You can see a layer's background or other aspects of that layer at any time simply by clicking the Layers icon in the Layers panel.

Q: How to convert an array of any type to an array of an interface type? I have a function, that receive as input an array of any type. What I want to do is to turn that array in an array of an interface type. I have a big array of objects, with different sub types and they all have a equals() function. What I want to do, is to take an array like this [String, String] or [Object, Object], and take only the String, and use the equals method of the String type. Actually, I will have a big if statement in my method, and I want to turn all if statements in an array comprehension like that: [if object.equals(string) doString] I'm having some difficulties on how to do this, can any help me, or have any idea about how to do this? Thanks in advance. A: You can just use the stream() method on Stream.of(..): Iterable strings = Arrays.stream(arrayOfStrings).filter(it -> it instanceof String) The Dittrick By EtienneDecolore Watch 51 Favourites 0 Comments 1K Views A shooting star fell down from the sky, its tail falling on a kid's head.
