In addition to PS4 and Xbox One.

Q: How to find file in a directory's sub-directories (Python 3.x) I have a Python 3.7 script that takes an input file, reads it line by line, and outputs each line to a separate.txt file. I am performing this process within a directory named 'Examples'. Within this 'Examples' directory, I have a sub-directory named 'Birthday Card Tree'. Within this sub-directory, I have a number of.txt files named 'birthday.txt'. Now, within the 'birthday.txt' files, there is a 'title' and 'category' column. For example, the line in a file would be like: Example 1 Title,category 1st Birthday Title,Category 2nd Birthday Title,Category 3rd Birthday Title,Category 4th Birthday Title,Category My python script needs to read these lines and create a.csv file in the same directory as the 'birthday.txt' file that lists all the unique titles and the respective categories. The issue is that Python 3.7 does not support in-built functions for doing this. I cannot rely on `find()`, because it looks inside the parent directory 'Examples' and does not look inside any of the sub-directories. That is, it cannot read the file 'birthday.txt' and look for a specific title.

A: Consider a simple directory tree

```
-- my_dir | |-- birthday_card_tree | | |-- birthday.txt | | |-- birthday.txt | | |--
```
